

The Fractioned Earth

Earth. It is more fragile than you think. The layer that protects us from turning to dust from the sun's radiation is only one inch thick. Did you know that?

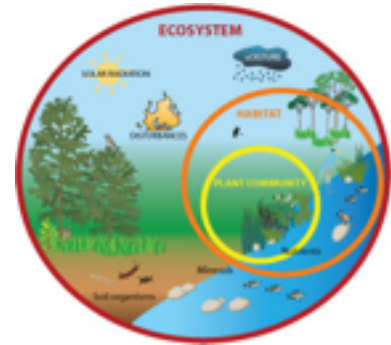

Earth. We share it with millions upon millions of other living beings from single celled organisms, to bacteria, to animals. Many of which we depend upon to breath and live. Are we taking care of them?

Earth. Life has prevailed in all types of environments...from the hot tropical rainforests to the cold tundra...despite natural and human made events. As humans, what is our affect on these environments, habitats, and animals? How can we make the world more aware of our affect on the delicate earth?

Driving Question: How can we help change human beings' interactions with our environment that could eventually lead to our own extinction?

The project product must contain the following information:

- A mathematically accurate visual representation of the land (represented as a whole) of earth broken into it's designated environments with **fractions** and **percents** displayed.
- Information about all types of **ecosystems** and some of the **communities** they support.
- Information about a particular plant or animal population in a chosen **ecosystem**.
- Information about this animal or plant's **role** as a **consumer** and/or **producer** in their **habitat**.
- Information about the **human affect** on their environment and forecast the effects of their extinction.
- Mathematically describe the **rate** of their **extinction** to support your **forecast**.
- A plan or **campaign** to help stop this decline in the environment.

Project Proposal

Explain your choice of ecosystem, animal/plant, and product.

Choose how you want to display/convey your project...3/D diorama and presentation? Interactive iBook? Published Book? A commercial or short movie? A story? A website? A Lino Board? A play? A Poem?

Make clear your voice.

How do you plan to reach the public with your message? Why do you feel it is so important?
